Peer Evaluation Form for Group Work

Group number #2
Your name Dawood Al-Janaby on behalf of Group#2

Write the name of each of your group members in a separate column. For each person, indicate the extent to which you agree with the statement on the left, using a scale of 1-4 (1=strongly disagree; 2=disagree; 3=agree; 4=strongly agree). Total numbers in each column.

Evaluation Criteria	Member: Ege Yesilyurt	Member: Weiqin Situ	Member: Arshia Hassanpour	Member: Raha Golsorkhi	Member: Dawood Al-Janaby	Member: Nurjahan Ahmed Shiah
Attends group meetings regularly and arrives on time.	4	4	4	4	4	4
Contributes meaningfully to group discussions.	4	4	4	4	4	4
Completes group assignments on time.	4	4	4	4	4	4
Prepares work in a quality manner.	4	4	4	4	4	4
Demonstrates a cooperative and supportive attitude.	4	4	4	4	4	4
Contributes significantly to the success of the project.	4	4	4	4	4	4
TOTALS	24	24	24	24	24	24

1. How effectively did your group work? (List at least 3 things)

Our group worked effectively because the work was split into clear features instead of everyone working on the exact same thing. In the repo, Ege worked a lot on the project setup, authentication, login and signup flow, profile pages, dark mode, and dashboard updates. Arshia worked on the fitness profile backend and frontend connection, while Nurjahan worked on creating and browsing programs and later the weekly schedule feature. That kind of split made the project feel more organized.

The group also worked well because different members kept building on each other's work instead of leaving everything isolated. For example, Raha added workout completion and later summary dashboard widgets and graphs, Weiqin added edit and delete for workout programs and then program feedback dashboard features, and I worked on the accept, reject, and lock flow for recommended schedule adjustments. So the repo shows that the project kept growing feature by feature, not staying stuck in one stage.

Another reason I think the group worked effectively is that the work was not only coding. The repo also shows testing, fixes, documentation, and cleanup work. My focus was mainly on the design process that usually won't show up in GitHub. Raha updated logs and added tests for workout completion and the summary dashboard, Nurjahan added schedule test cases, Arshia added profile API test cases, and Ege handled a lot of repo cleanup, merges, and README updates. That helped the project feel more complete overall.

2. Were the behaviors of any of your team members particularly valuable or detrimental to the team? Explain. (List at least 3 things)

Ege's work was especially valuable because he helped create the base of the project early on. From the repo, he set up the full stack structure with Next.js, Django, MySQL, and Docker Compose, then worked on the authentication system, login and signup pages, theme support, dashboard changes, and profile-related features. That was important because it gave the group something solid to build on instead of everyone waiting around at the start.

Raha and Nurjahan were also really valuable because they contributed features that made the app feel more usable from the user side, and they also helped with testing and documentation. Raha worked on workout completion, in progress workout status, summary dashboard widgets, and test files, while Nurjahan worked on trainer program browsing, create and browse program features, weekly scheduling, accessibility

improvements, notifications, and schedule test cases. Their work helped move the project forward in a practical way, not only in planning.

Arshia and Weiqin added focused features that improved important parts of the app. Arshia worked on the fitness profile endpoints, and later the training trends analytics dashboard work. Weiqin added edit and delete functionality for workout programs and later worked on the program feedback dashboard. Those contributions helped make the system more complete and polished.

For my own part, I contributed to the repo with the recommendation adjustment flow, specifically the accept, reject, and lock behavior for schedule adjustments in user story 2.5 (in process). That touched both backend and frontend files, including models, serializers, views, and the schedule page. I think that was valuable because it added a user control feature instead of the app only making automatic changes. I recognized some overlap in this user story and I am working on redesigning it to eliminate repetition.

I would not say any member was seriously detrimental based on the repo history. The only thing I noticed is that, like most group projects, a lot of work happened close together near deadlines, so integration probably became more stressful at those points. Still, the repo does show everyone contributing something useful.

3. What did you learn about working in a group from this project that you will carry into your next group experience? (List at least 3 things)

One thing I learned is that setting up the project properly at the start saves a lot of pain later. In our repo, the early setup with Docker, the frontend and backend structure, and the auth foundation made it easier for the rest of the features to be added after. Without that, the later work probably would have been way more chaotic.

I also learned that dividing work by feature is helpful, but people still need to keep checking how their work connects with everyone else's. In our project, profile features, program browsing, scheduling, workout completion, recommendations, analytics, and dashboard updates were all connected in some way. So even when people had separate tasks, the final app still depended on those parts fitting together properly.

Another thing I learned is that testing and cleanup matter a lot more than people usually think at first. The repo shows that some members were adding test cases, fixing bugs, updating logs, and cleaning repo files while others were building features. That stuff

is not always the flashy part of the project, but honestly it is part of what makes the final submission look finished.

I also learned that good group work is not only about who writes the most code. Some people help by building major features, some help by testing, some by improving UI, some by documentation, and some by keeping the repo organized. Looking through our repo made that pretty obvious.
